Numerical modeling permitted to reproduce the failure surface by back-analyses of the in situ stress, and also by the rock and discontinuity properties. The failure reached many benches, as it can be seen in Fig. 14. A buckling failure limited to the bench slope has been observed, as it can be seen in Fig. 7.

A numerical model for predicting erosion due to overtopping flow at a river embankment was developed by combining four modules: surface flow, seepage flow, sediment transport, and slope failure. The novelty of this study is in combination of these modules to reproduce the complicated embankment failure process.

Usually, the failure mode in numerical modeling is judged by comparing the model response with a known model response that is considered as stable failure. For example, it is widely accepted that failure in an Uniaxial Compression Strength (UCS) test simulation is stable if a rigid loading system is used (Garvey, 2013 , Kias and

The PhD project will focus on numerical modelling of stresses and failure of the borehole wall under repetitive impacts by the drillstring. The main goal of the PhD project is to develop a model and methodology that would enable prediction of impact-induced borehole instabilities in different rock types and under different drilling conditions.
